1) Progress made thus far
The website is deployed.
Front-end is near finished.
The database is built. It is based on university, location, name, and other information.

2) Remaining tasks
The backend and the search function.

3) Any challenges/issues being faced.
Based on the TA's instruction, I have narrowed my goal into "replicate ExpertSearch," and I would like to make sure if this is sufficient.
I find my peers say the course TA could provide the existing data. I wonder if this is true.
